

Ocean Mixing

Contact point:

Toshiyuki Hibiya (The University of Tokyo)

Overview:

To clarify the distribution and magnitude of tidal mixing in the Indonesian Seas, we plan to carry out direct microstructure measurements throughout the deep ocean mainly in the mixing hotspots predicted by three-dimensional numerical simulations. In order to identify the key region for the water-mass transformation, we also conduct CTD/LADCP measurements to clarify the physical processes for the transformation of the ITF water.

Objectives:

Study on turbulent mixing in the Indonesian Seas and its effect on the water-mass transformation.

Period:

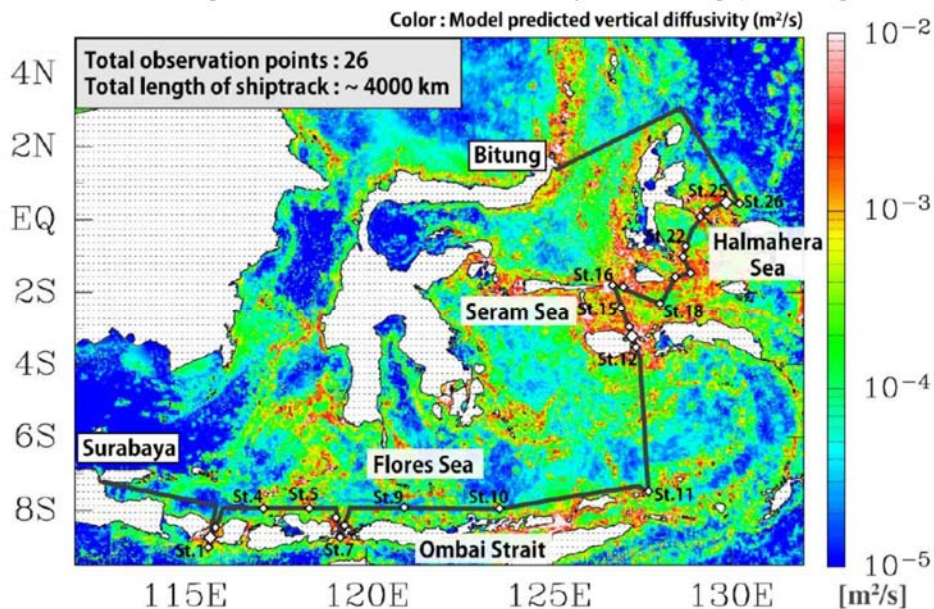

February 26 – March 17, 2019

Participants:

Indonesia: Agency for the Assessment and Application of Technology (BPPT)
Ministry of Marine Affairs and Fisheries (KKP)
Bogor Agricultural University (IPB)
Padjadjaran University
Japan: The University of Tokyo
Marine Works Japan Ltd.

Location:

Research will be conducted along the cruise track between Surabaya and Bitung (excluding “Banda Sea”).

Observations:

Vertical Microstructure Profiler eXpendable (VMP-X), Vertical Microstructure Profiler 5500 (VMP-5500), CTD, LADCP, and Shipboard ADCP.
