

Subsurface Fluxes Beneath Large-Scale Convective Centers in the Indian Ocean

Jim Moum

(Oregon State University)

- intensive & detailed shipboard profiling
- mixing meters on moorings

Ren-Chieh Lien (APL / University of Washington)

- Dynamo moorings (3) + *mixing meters*

Mike McPhaden (NOAA / PMEL)

- RAMA moorings + *mixing meters*

DYNAMO / NSF-related objectives

measure $T(z)$, $S(z)$, density(z), currents(z), esp. SST

$$\frac{\partial \text{SST}}{\partial t} = \text{surface flux} + \text{advection} - \frac{\partial(\text{turbulent flux})}{\partial z} + I(z)$$

ONR DRI-related objectives

- quantify the detailed vertical and time-varying structure in both velocity and stratification of the Wyrтки jets. This measurement leads to estimation of Ri and potential parameterization of mixing;

assess negative feedbacks to atmospheric convection → $d\text{SST}/dt < 0$

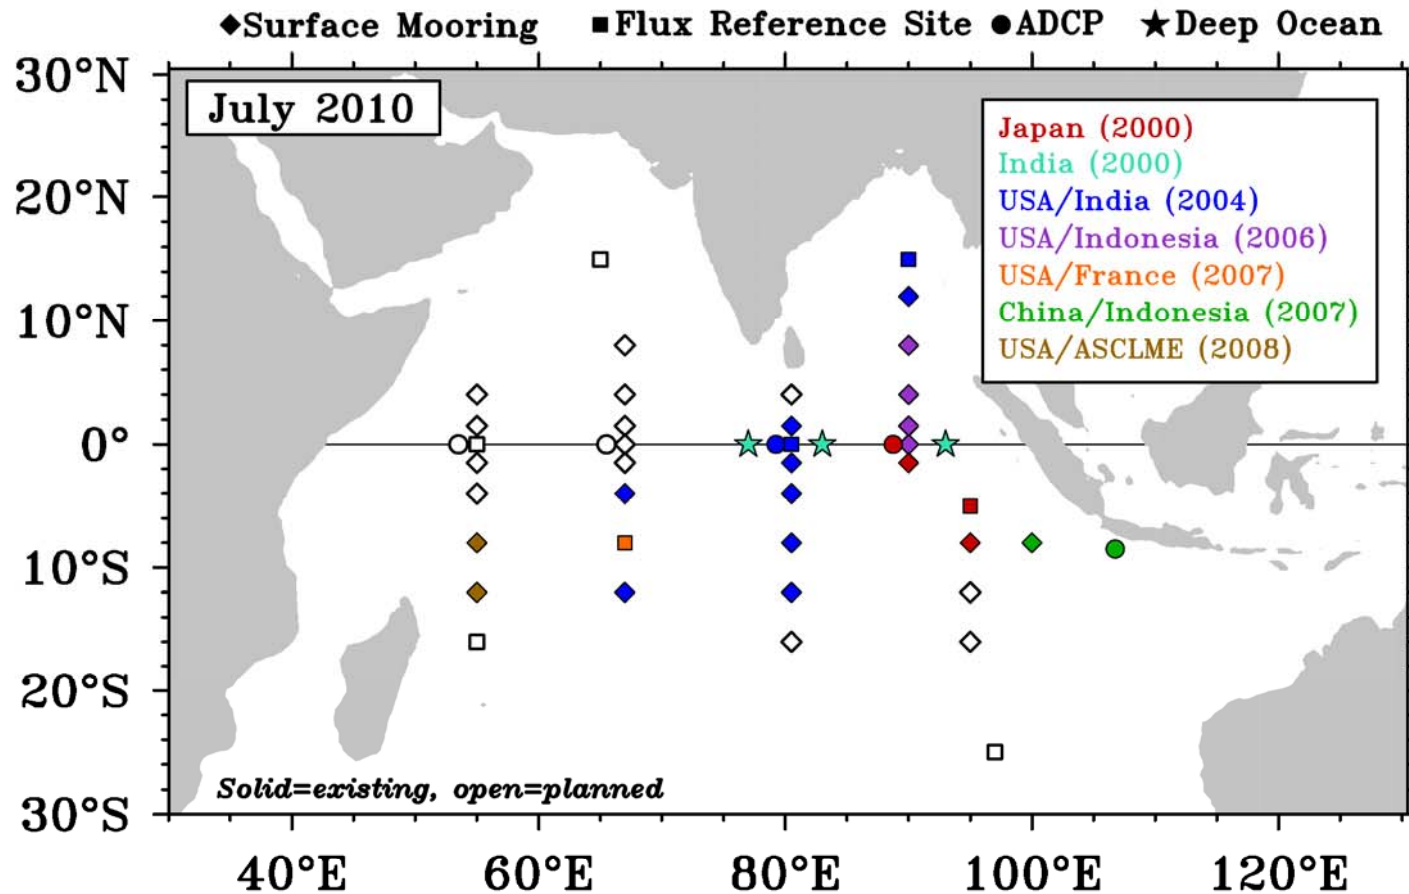

- quantify sea surface cooling rates due to wind mixing and diurnal cooling;
- quantify sea surface cooling rates due to shear instability created by the highly-sheared currents, particularly the Wyrтки jets; and

assess positive feedbacks to atmospheric convection → $d\text{SST}/dt > 0$

- quantify sea surface heating rates (from both above and below) in thin near-surface fresh layers deposited by convective precipitation.

RAMA

Research Moored Array for African-Asian-Australian Monsoon Analysis and Prediction (**RAMA**)

DYNAMO Moorings

equatorial mooring 0° 76°E

Wyrтки Jet

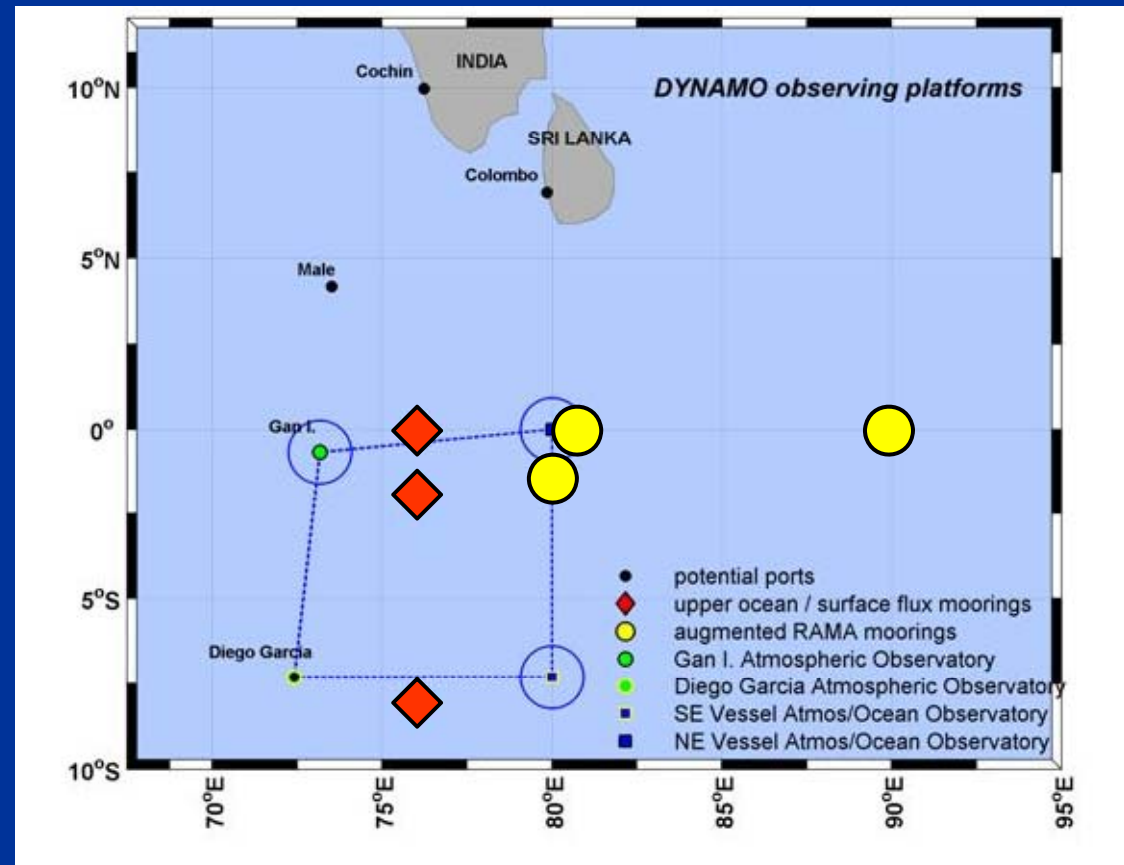

shear-driven, low Ri mixing

array central mooring 2°S 76°E

meridional extent of
Wyrтки jet?

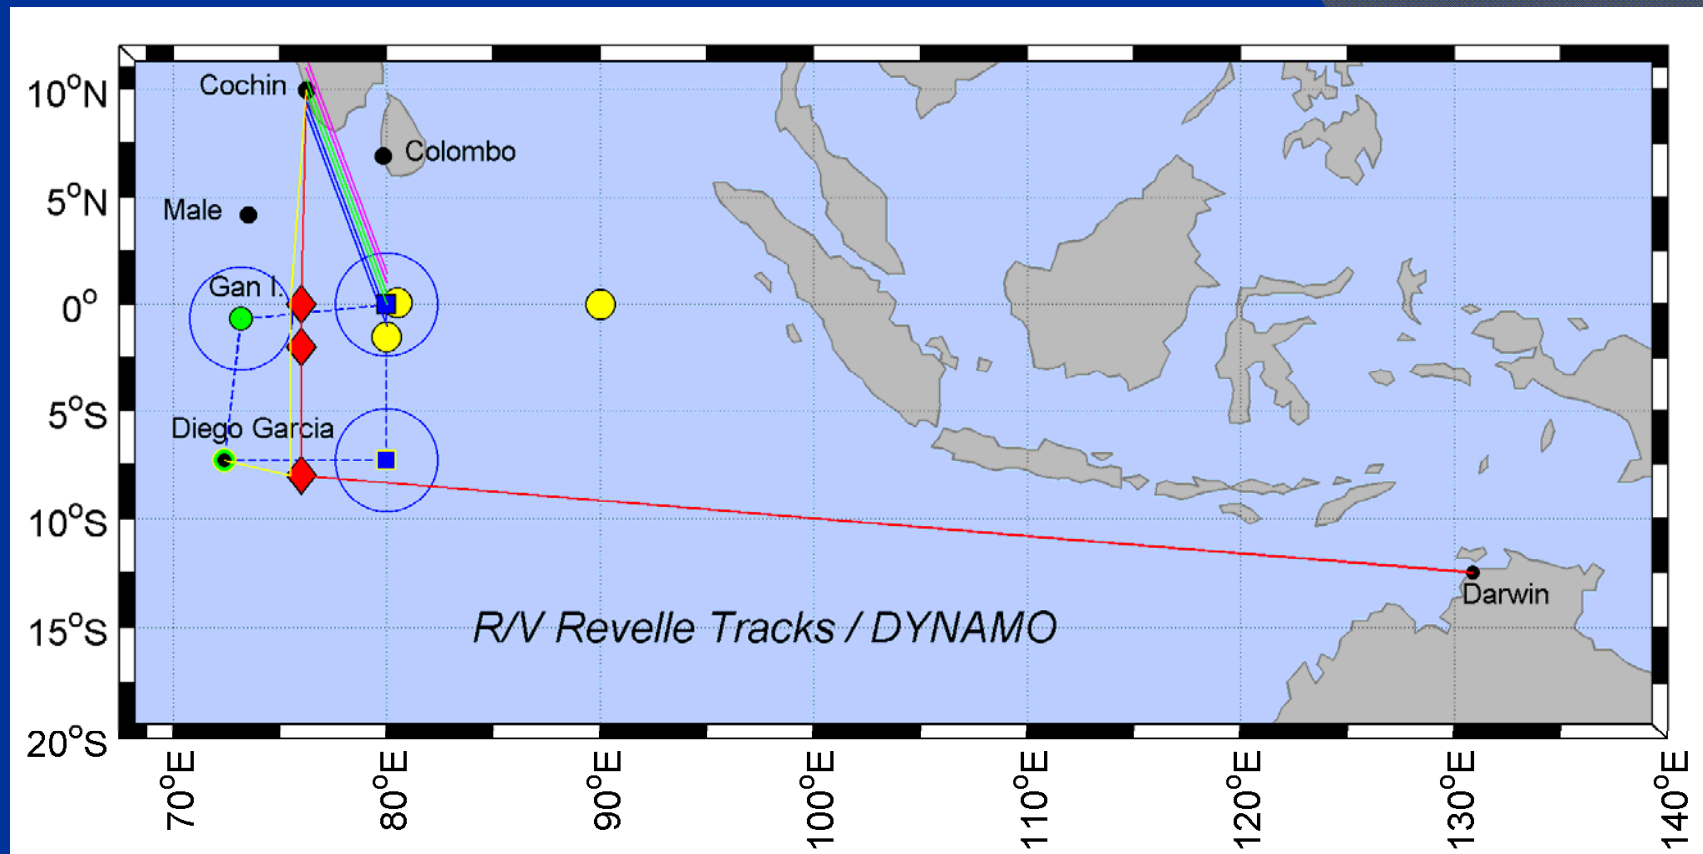

SCTR mooring 8°S 76°E

mixing in SCTR where large
SST variability has been
observed

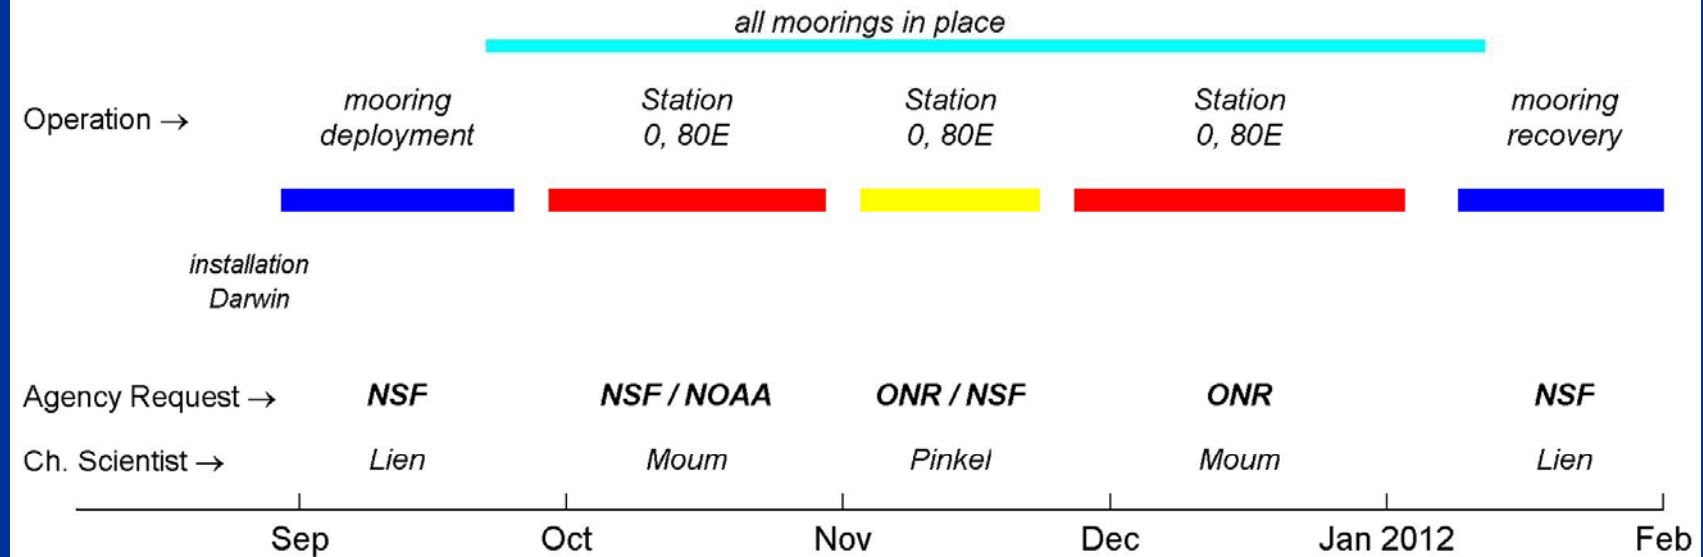

RAMA moorings

augmented with x-pods

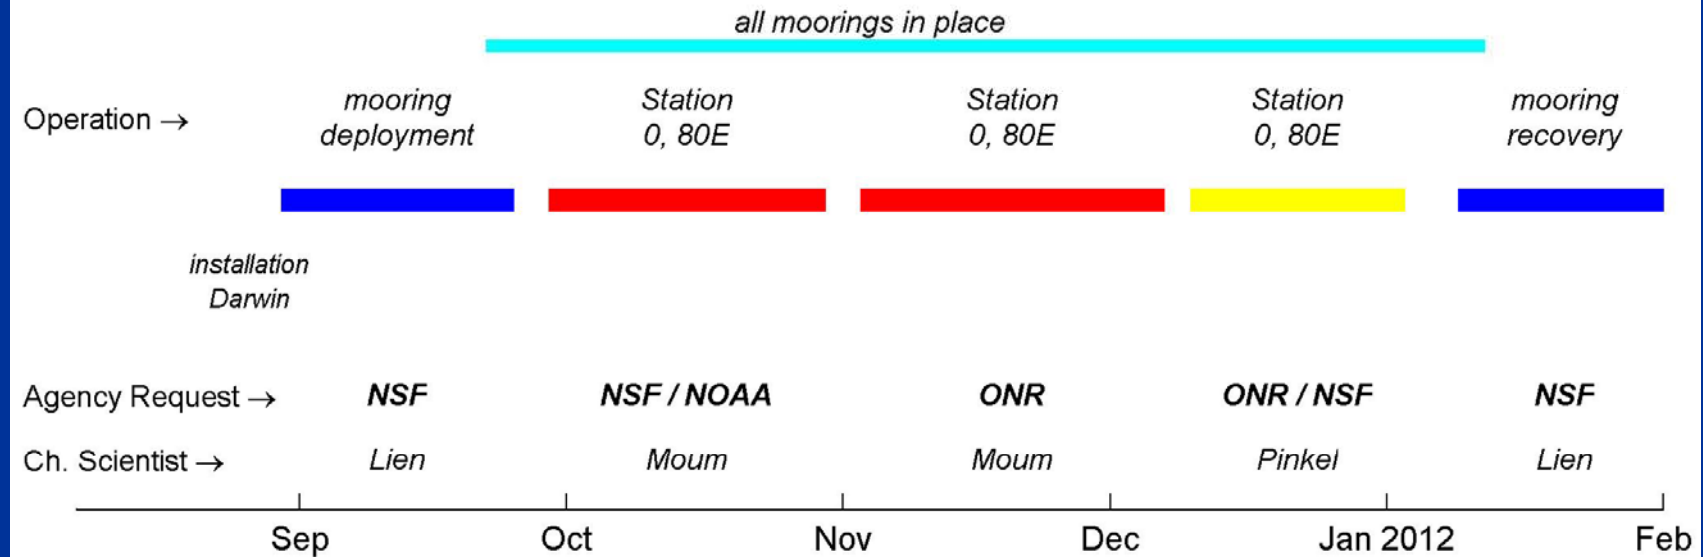

R/V Revelle Timeline ver.1

Installation	23 Aug – 30 Aug
Deployment	30 Aug – 25 Sep
Moum Leg 1	28 Sep – 30 Oct
Pinkel Leg 2	03 Nov – 23 Nov
Moum Leg 3	27 Nov – 03 Jan
Recovery	09 Jan – 03 Feb

R/V Revelle Timeline ver.2

Installation	23 Aug – 30 Aug
Deployment	30 Aug – 25 Sep
Moum Leg 1	28 Sep – 30 Oct
Moum Leg 2	03 Nov – 08 Dec
Pinkel Leg 3	12 Dec – 03 Jan
Recovery	09 Jan – 03 Feb

DYNAMO moorings subsurface expression

χ pods on DYNAMO / RAMA moorings

- moored subsurface flux measurement
- analogous to a surface flux tower

Moum & Nash 2009

shipboard profiling 24h ops / fixed station

Chameleon turbulence profiler

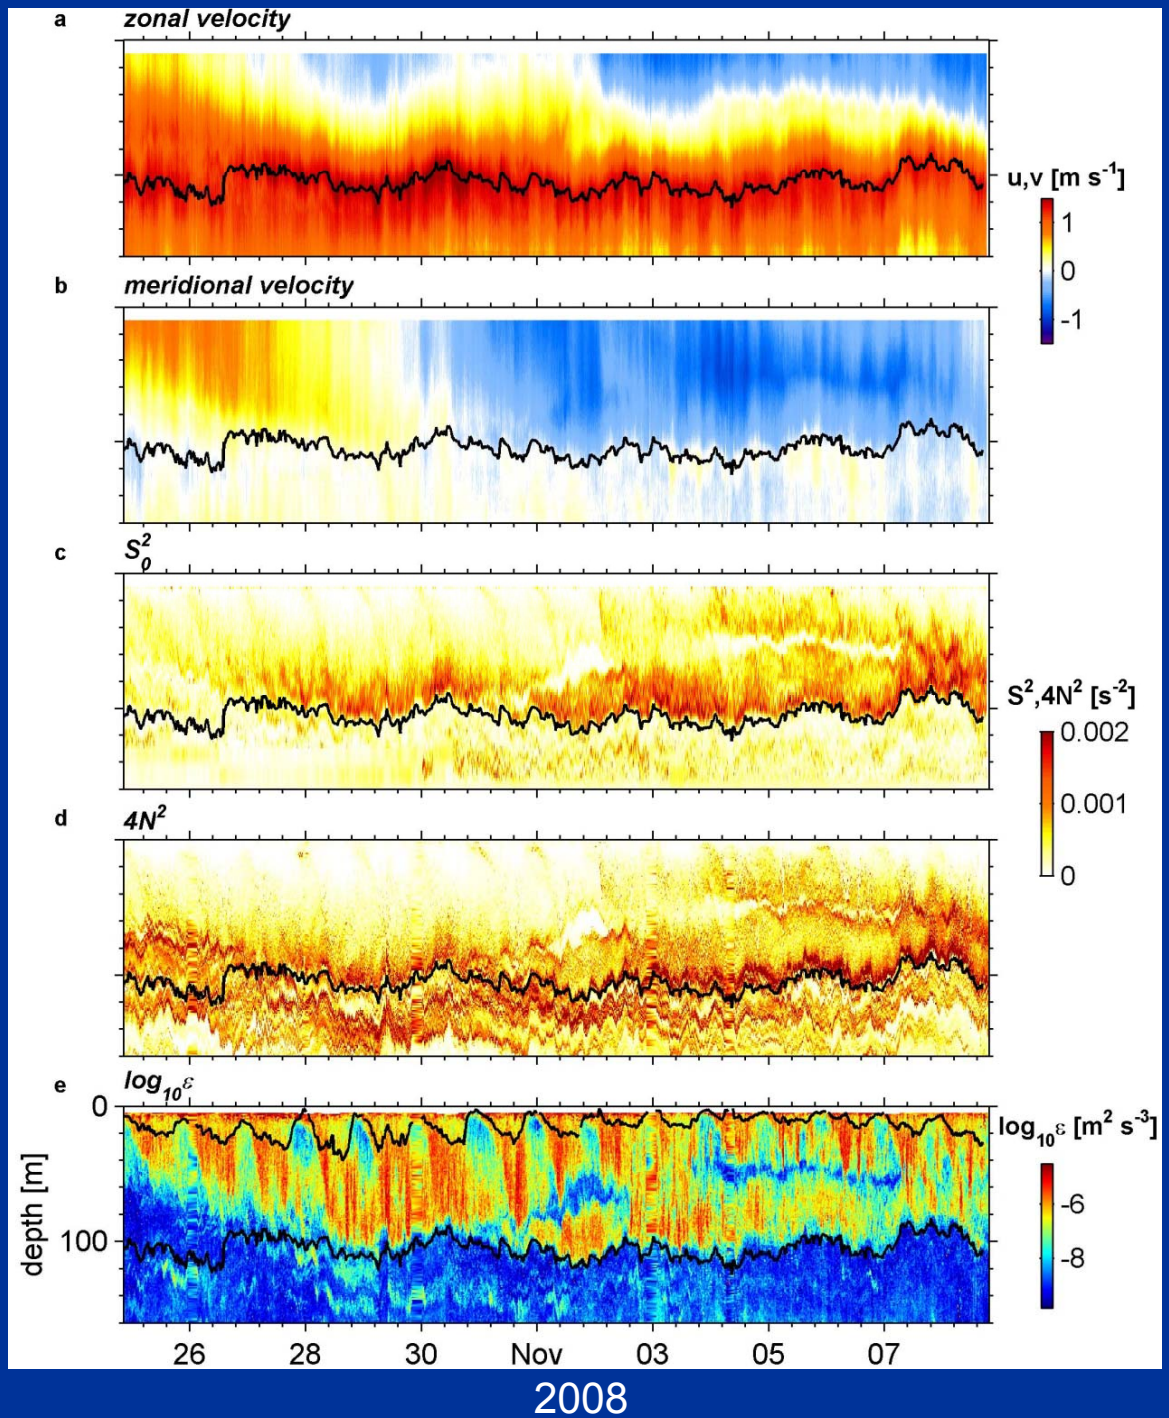

An example of how the Ocean *does not* care
what the Atmosphere does but the Atmosphere
has to care what the Ocean does!

TIWs cool the sea surface independently of
surface forcing!

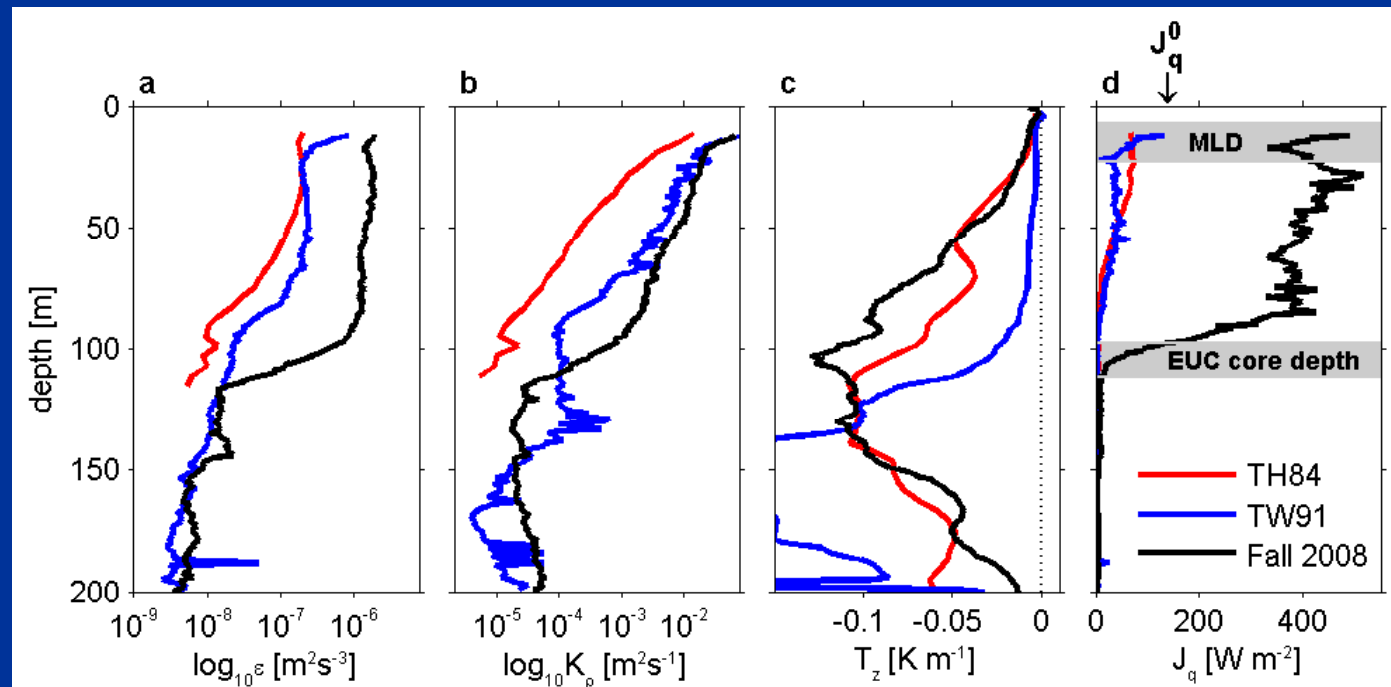

Nature Geophysics, 2009

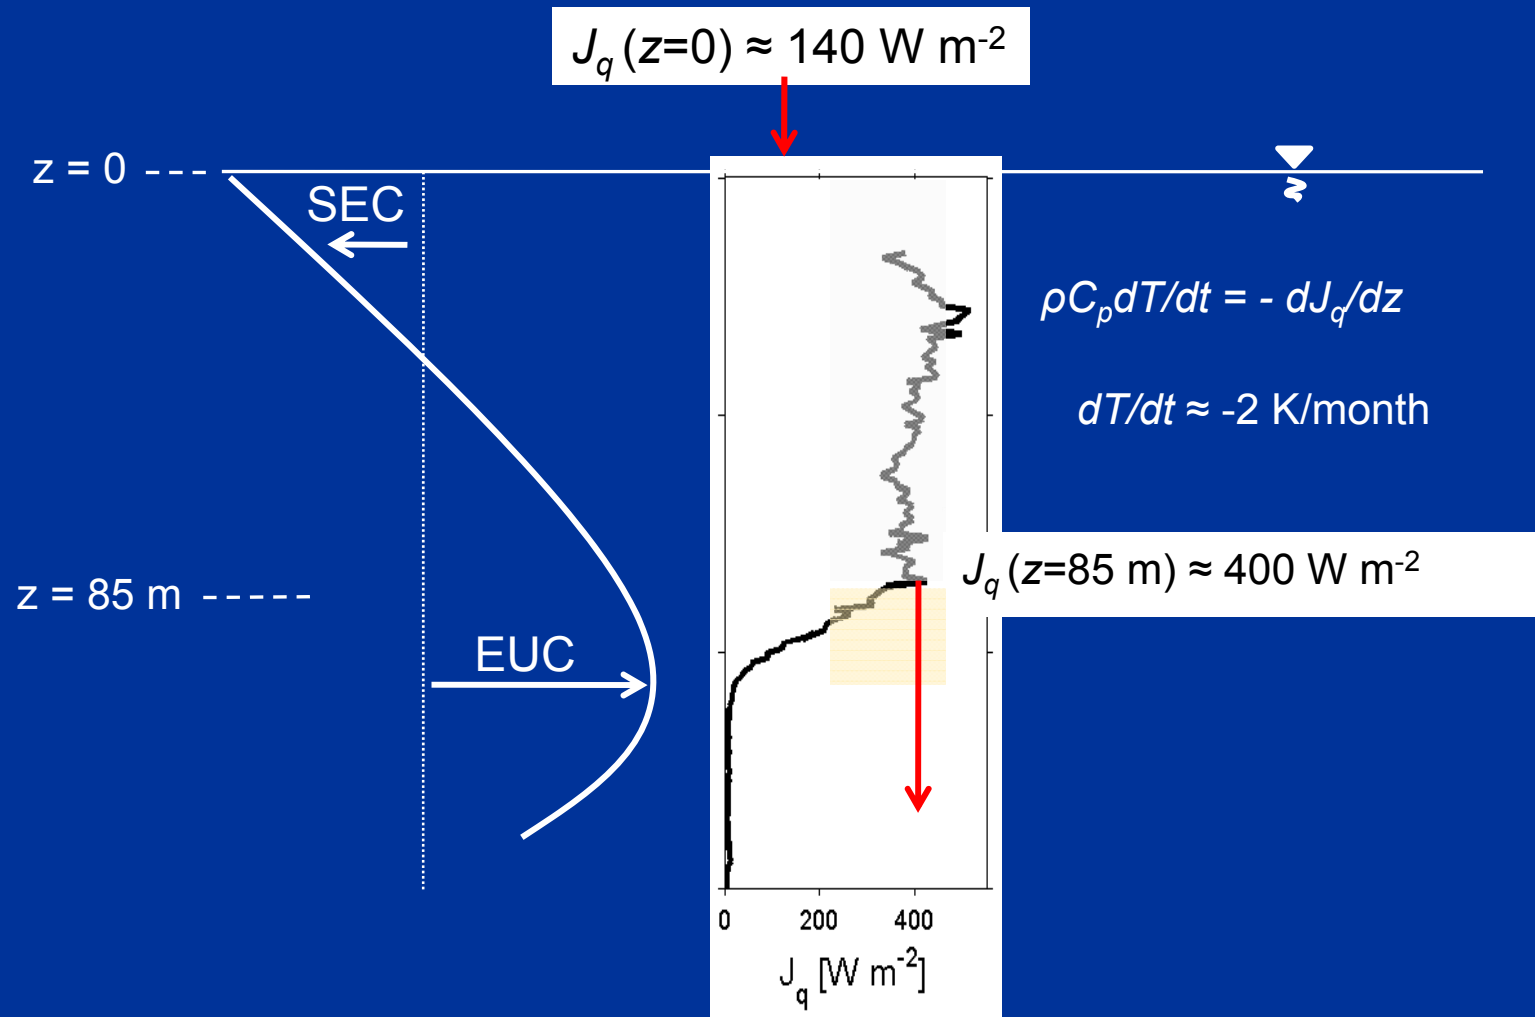

upper ocean structure
0 140W
boreal fall 2008

*TIW – enhanced
subsurface mixing*

subsurface fluxes in TIW (black)
SST cooling rate > 2 K/month

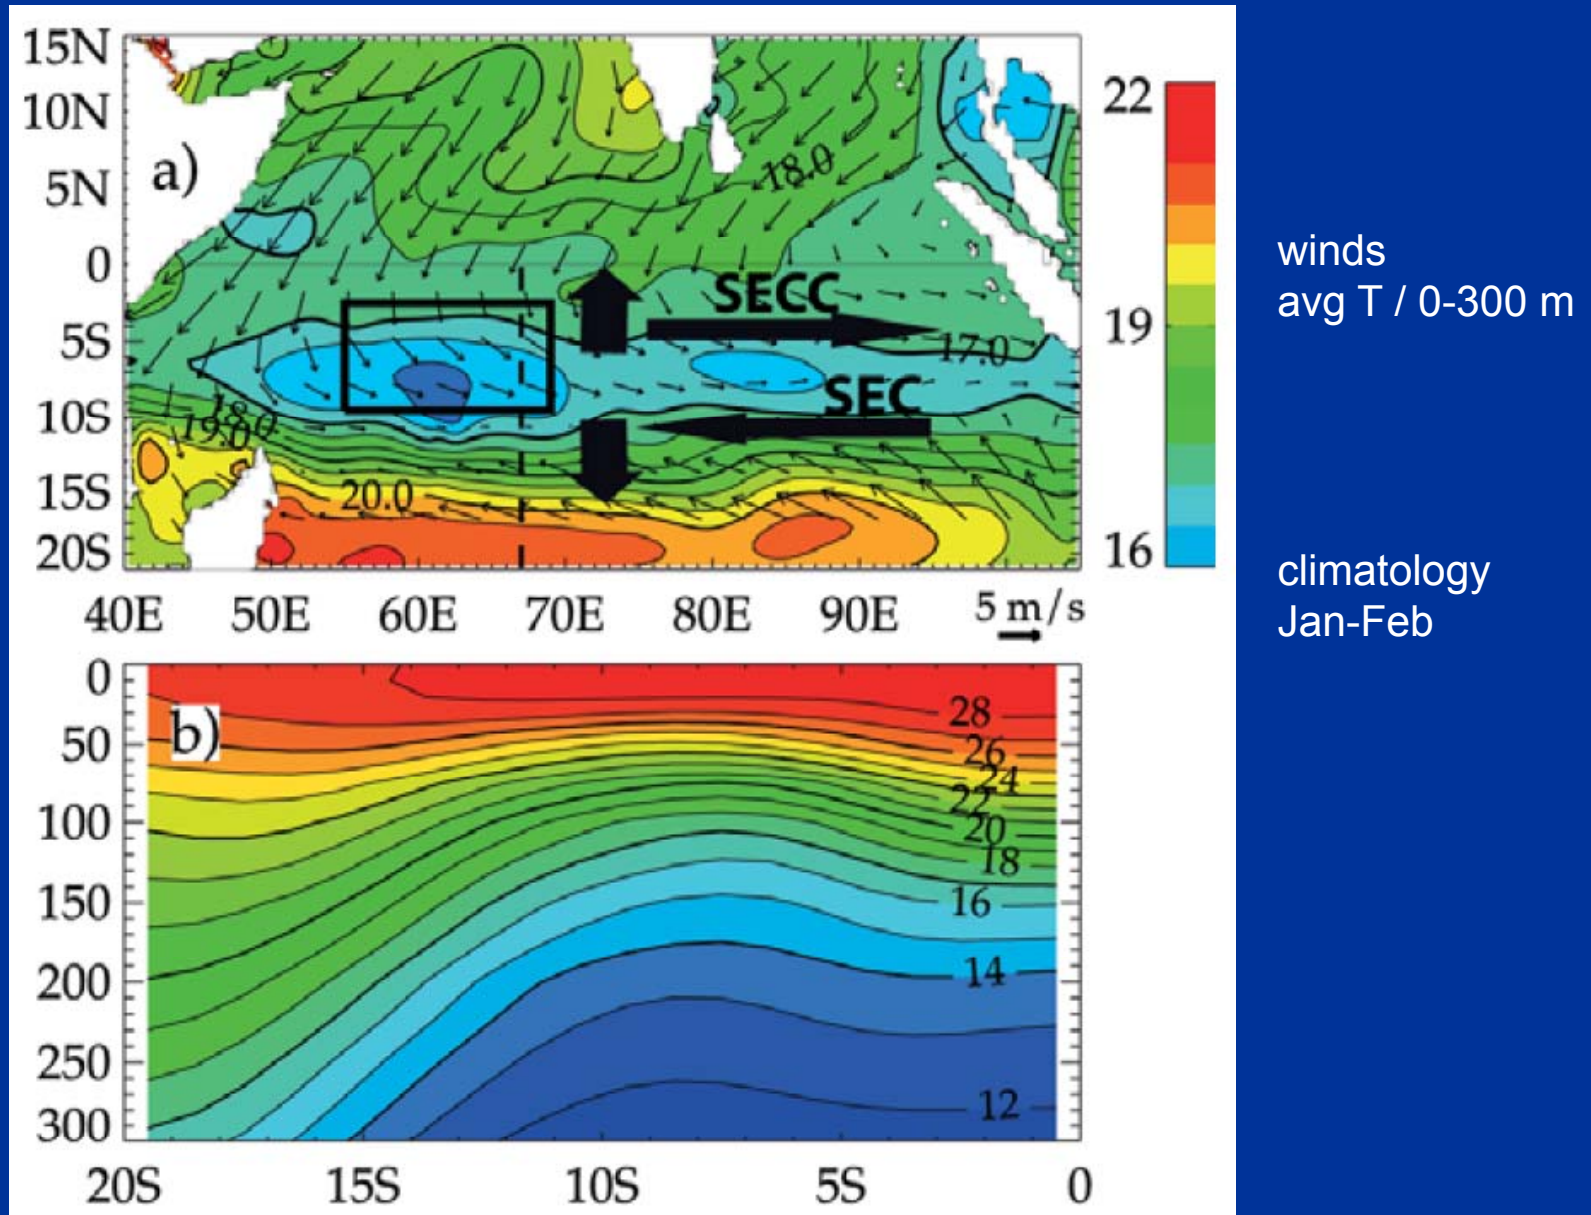

cooling of upper 85 m $\rightarrow -2 \text{ K/month}$

heating of EUC (85-110 m) $\rightarrow 10 \text{ K/month}$

Seychelles-Chagos Thermocline Ridge south of equator

Wyrтки Jets at the equator

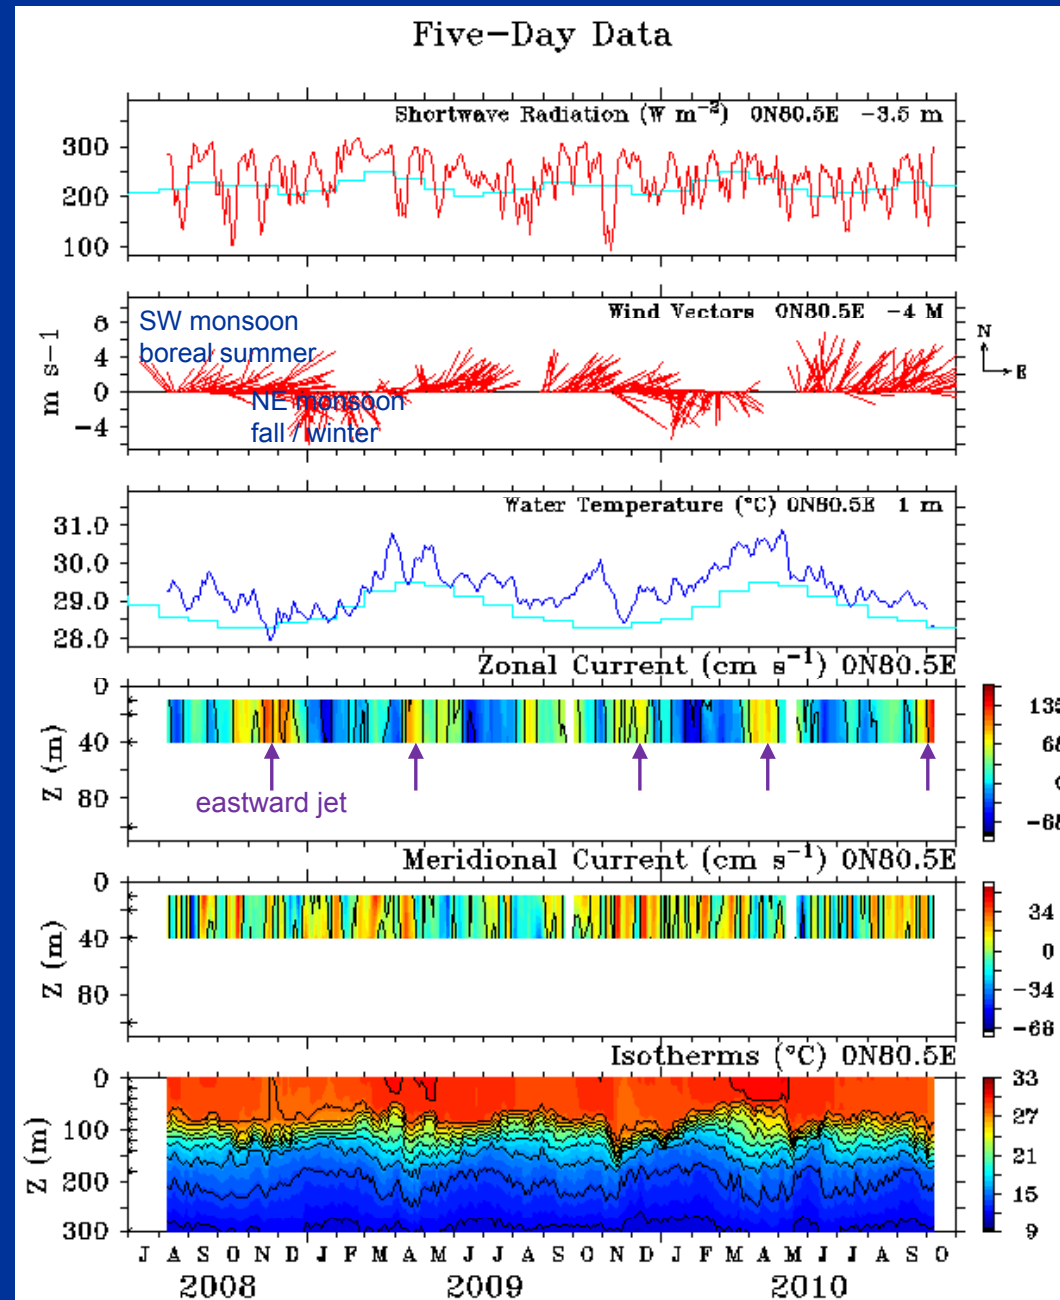

Zonal currents in the equatorial Indian ocean at 0 80.5E. Intense eastward currents in boreal spring and fall are the Wyrтки jets. These measurements from subsurface ADCPs indicate strong vertical shear but which we know to be attenuated. (Nagura & McPhaden, 2008)

RAMA data

0, 80E

easy to get from website

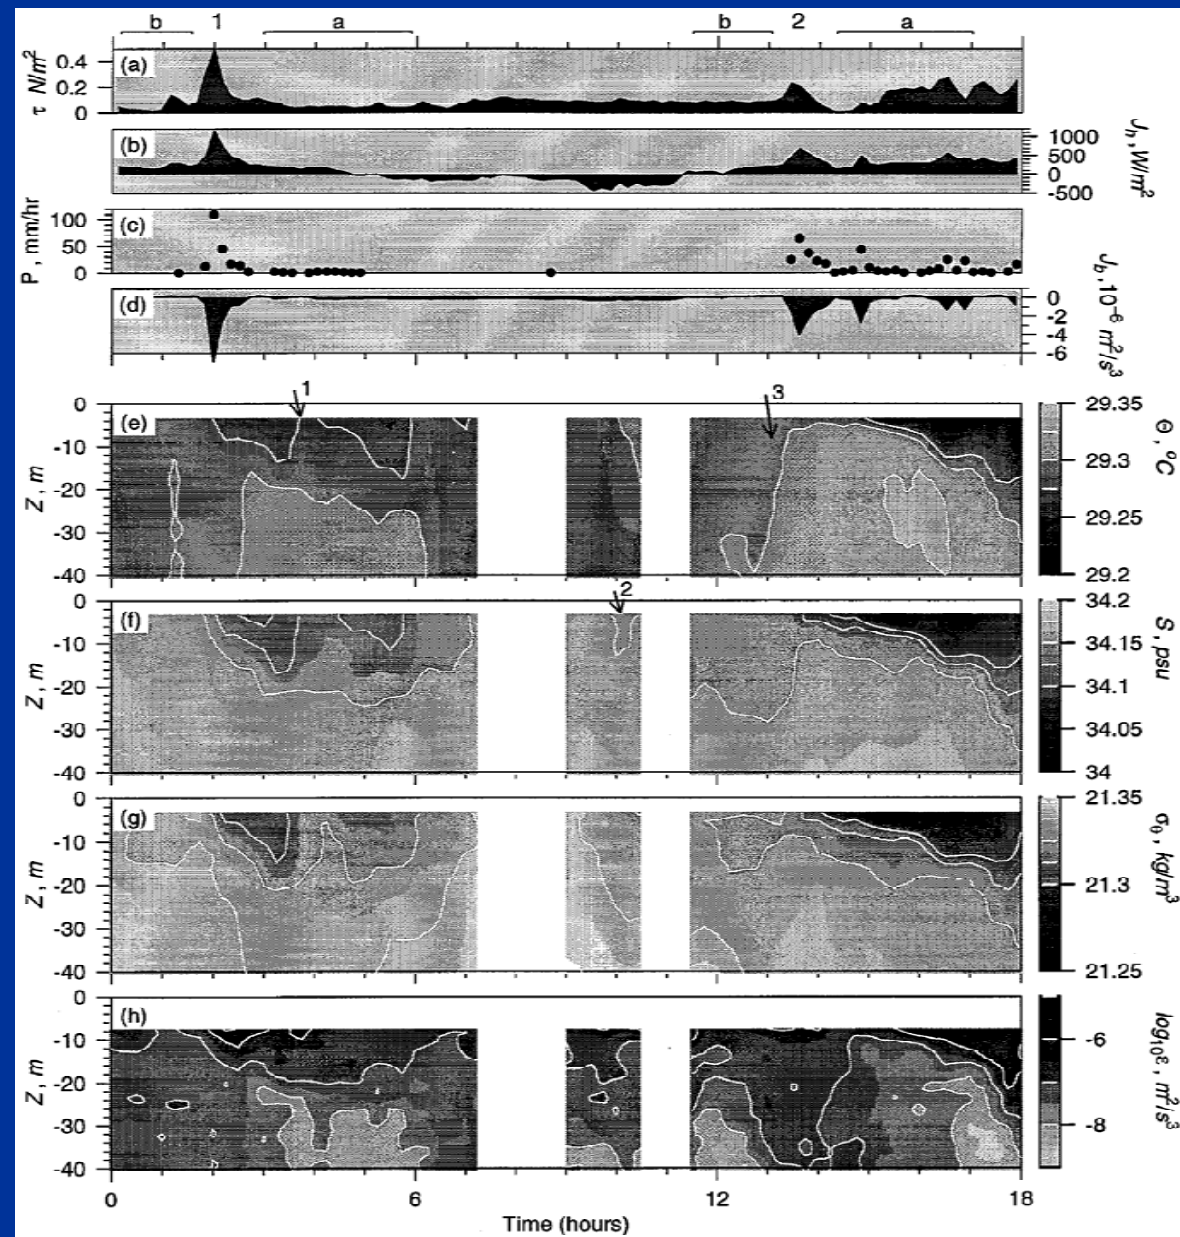

18 h time series
from COARE

squalls excite near-surface
mixing

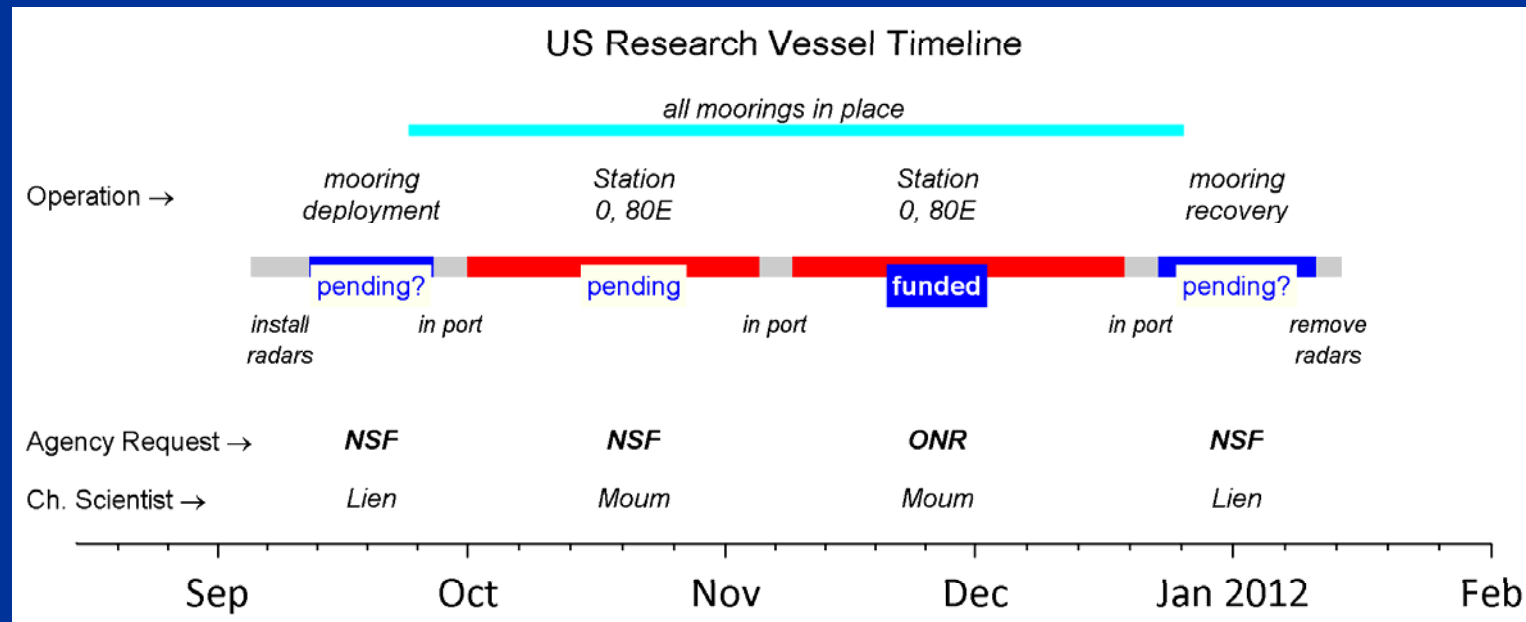

cool precip. isolates near-
surface from subsurface
reducing subsurface mixing

fresh, cool puddles spread
like gravity currents

puddles heat from above and
below

Smyth et al 1996

from Ren-Chien Lien:

deployment cruise plan to load in Darwin, get on at Cocos Keeling, and off at Cochin.

I would like to bring Scripps' Seasoar for surveys around mooring array. No extra shiptime requested. Will use built-in weather days. Objective – map out barrier layer.

On the **recovery cruise**, we will get on at Cochin, and off at either Diego Garcia or Port Louis. We need to find out the shipping cost too. The latter seems simpler.
